Woodflow for the Republic of Ireland for 2008

Gordon Knaggs¹ and Eoin O’Driscoll²

Roundwood harvest and roundwood available for processing

In 2008, roundwood available for processing was 2,503,000 m³ (Table 1), a reduction of 18% on the 2007 level. This was mainly as a result of a sharp decline in construction activity.

Coillte supplied 91% of roundwood, with the balance coming from privately-owned forests and from imports. Private harvest declined sharply on 2007 levels, by some 70%, to 118,000 m³ - a number of forest management companies surveyed recorded no harvesting activity for 2008. Net imports of roundwood contributed an additional 106,000 m³ (Table 1). The assortment breakdown is provided in Table 2.

Timber products trade (2008)

In 2008, imports of forest products exceeded €789 million, mainly pulp and paper products (over 66%), with sawn timber and wood-based panels making up the remainder. A reduction in Irish construction output led to a significant reduction in sawn timber imports in 2007 and in 2008\textsuperscript{8} (Table 5).

Source: Central Statistics Office (CSO) www.cso.ie

Nine companies form the core of the Irish sawmilling sector, providing the outlet for sawlog and stakewood harvested from Irish forests. In 2008, Irish sawmills utilised 1.62 million m\textsuperscript{3} of roundwood. Output was 780,000 m\textsuperscript{3} of sawn timber\textsuperscript{11}. The primary products produced included construction timber, pallet and fencing products. While Irish construction timber is largely sold on the home market, pallet and fencing products make up the bulk of sawn timber exports.

The sector has been badly affected by the downturn in construction activity. In 2008, many sawmills closed for short periods to better match sawn timber output with market demand. As a result, output declined by 6% over 2007.

Sawn timber exports (almost all to Great Britain) were worth €54 million, comprising mainly pallet wood and

\textsuperscript{5} Wood fibre that is reused is counted twice in this model.

\textsuperscript{6} This includes bark (from the debarking lines at Medite and SmartPly) and sawdust produced from the sanding of wood-based panels.

\textsuperscript{7} Wood biomass is used by the forest products sector for process drying, heating and for the generation of electricity.

\textsuperscript{8} Sawn timber imports are reported in Ireland’s EUROSTAT JFSQ return for 2007 and 2008.

\textsuperscript{9} This table includes import/export figures for sawn timber, wood-based panels (WBP) and pulp/paper products only. Data are taken from Ireland’s EUROSTAT JFSQ returns (2007 – 2008). Roundwood, sawmill residues and secondary processed timber products are not included.

\textsuperscript{10} These data are based on Ireland’s EUROSTAT Joint Forest Sector Questionnaire (JFSQ) return for 2007 and 2008.

\textsuperscript{11} This output includes the production of round stakes.
fencing products. Despite difficult market conditions and unfavourable euro/sterling exchange rates, sawmill exports in 2008 were slightly in excess of 2007 (Table 5).

The panel products sector had a combined output of 779,000 m$^3$. Output was 15% down on 2007, largely due to a reduction in construction activity in both home and export markets. Raw materials used were pulpwod, sawmilling residues (sawdust, woodchip and bark) and post-consumer recovered wood (PCRW). Overall, the wood fibre requirement for WBP manufacture was 1.462 million m$^3$.

Products manufactured by the sector include chipboard/particleboard, Oriented Strand Board (OSB), Medium Density Fibreboard (MDF) and moulded door facings. The sector is export orientated, selling more than 75% of its products in overseas markets. The companies involved are listed in Table 6.

In 2008, Irish wood-based panel (WBP) and sawn timber exports were worth €249 million (Table 5). Wood-based panels accounted for 78% of this total\textsuperscript{12}. Compared with 2007, the value and volume of WBP exported from Ireland has declined considerably (Table 5)\textsuperscript{13}.

### Wood residues and post-consumer recovered wood (PCRW)

Wood residues include bark, sawdust and wood chip. These are produced in both sawmills and in wood-based panel (WBP) plants. In 2008, the output of residues from Irish sawmills was 0.884 million m$^3$. Post-consumer recovered wood (PCRW) obtained by chipping used pallets and timber sourced from construction waste is estimated to have added a further 0.208 million m$^3$ of feedstock\textsuperscript{18}. Residues produced during the manufacture of WBP\textsuperscript{19} added a further 0.106 million m$^3$.

Wood residues and recycled wood fibre are primarily used as a feedstock for board manufacture. A small volume of wood residues is exported. However, in recent years, other uses for wood residues have emerged. These include bark mulch, wood pellets, and biomass/combined heat and power/boiler fuel.

Combined heat and power (CHP) is the generation of both thermal and electrical energy in a single process, normally using fossil fuel such as natural gas. In this way, more

efficient use is made of the energy available from the fuel. CHP installations can typically convert between 80% and 90% fuel energy into electrical power and useable heat. This compares with conventional power generation, which typically has a delivered energy efficiency of only 30%. Moreover, international evidence from the paper and board sectors shows that CHP can reduce total site energy bills by as much as 30%.

Biomass CHP uses renewable fuels to generate heat and electricity; these fuels are derived from four main sources:

- forest residues
- agricultural residues
- processing residues and waste and
- residues from crop processing.

Where wood is sourced from sustainably managed forests it is a renewable source of energy, with high greenhouse gas (GHG) emission savings. For example, each megawatt (MW) of electricity generated from wood fuel saves carbon dioxide (CO₂) emissions of 7,500 tonnes/year.

Drivers of timber demand

**Housing and timber frame output** 20, 21,22,23

Housing is an important driver of timber sales (an average new house uses 7 m³ of timber). Since 2007, the Irish housing sector has been in severe decline, with 2008 the most difficult year in many decades. In 2008, the total number of planning permissions for houses and apartments fell to its lowest level in ten years, to just 67,584 units24. Moreover, in 2008, the Construction Industry Federation (CIF) estimates that 35,000 homes and apartments remain unsold in Ireland.

In January 2009, employment in the construction sector stood at 190,000, down 90,000 from its peak in Q3 200725. As a result, the industry is going through a severe re-adjustment. This retrenchment is having a significant effect on the demand for forest products. House completions over the period 1990-2008 are shown in Table 7.

28 House completion figures for 2009 are forecast.
Timber frame house construction\textsuperscript{30} is an important part of the Irish construction sector, but it too has contracted in line with the overall fall in construction.

\textbf{€/£ exchange rate}

Since late 2007, the euro has strengthened against sterling by 24%. This has made Irish timber exports less competitive in the UK, and has, of course, improved the competitiveness of UK producers in the Irish market.

Movement in the €/£ exchange rate is shown in Table 8. Forecasts by Barclays Bank anticipate no major change in rates up to July 2010.

\textbf{UK construction market}

The UK construction market is a key export market for forest products. However, since late 2007 new house building starts have also slowed considerably in Britain. Conditions in early to mid 2008 deteriorated further, with housing starts and completions well down on 2007, followed by a series of increasingly pessimistic announcements from builders, indicating severe problems in the sector\textsuperscript{34}.

These sentiments are echoed in the UK’s National House Building Council (NHBC)\textsuperscript{35} statistics released in July 2008\textsuperscript{36}. They show that there was a serious decline in UK housing output during Q2 2008. Over 2008 as a whole, the number of NHBC\textsuperscript{37} registrations for new build fell to under 107,000, a drop of 47% on 2007\textsuperscript{38}. Moreover, the prospects for the UK housing market have not improved in the first half of 2009. NHBC figures show that private housing starts for the three months to the end of February 2009 have plunged 72% against the same period last year\textsuperscript{39}. In January 2009, the NHBC Chief Executive stated that: UK house completion figures for the 2008 are the lowest since our computerised records began. These are 18% lower than the previous lowest year, which was 1992 when 130,998 new homes were started. In 2008 several UK regions experienced a decrease in new home starts in excess of 50% when compared with the previous year. These regions include Scotland, Wales, Northern Ireland, North East, Yorkshire, the Humber, North West and the West Midlands\textsuperscript{40}. Furthermore, the NHBC anticipates that the volume of new home starts in the UK will remain relatively low throughout 2009.

Developments in wood supply and processing

Spanboard ceases chipboard manufacture in Northern Ireland

In 1959, chipboard production began at Spanboard Products Ltd., located outside Coleraine, Co Derry. In 1989, the facility was acquired by Sonae Indústria, Portugal’s largest privately owned industrial group. However, in January 2009, Sonae announced that it was ceasing production of raw chipboard at the Spanboard facility, referring to the downturn in the construction industry, combined with the rising cost of raw materials. Spanboard will however remain open, and will now concentrate on producing value-added products, including manufacturing melamine-faced chipboard from raw chipboard sourced from Sonae (UK).

New wood pellet plants

D Pellet Ltd, the first wood pellet production facility to operate in the Republic of Ireland, commenced production in 2008. The plant is located at Knocktopher, Co Kilkenny, and has a capacity to produce 75,000 tonnes of wood pellets per annum.

In early 2009, Laois Sawmills commenced production of wood pellets at its Portlaoise sawmill and is currently supplying wood pellets in bulk form.

In May 2009, Imperative Energy announced that it is in the process of building a wood pellet, bio-refining and CHP facility at Claremorris, Co Mayo. When fully operational, the facility will have a capacity to produce 60,000 tonnes of pellets/annum, together with a 15MWth/5MWe CHP plant. The plan also includes a bio-processing plant, with an annual capacity of 20,000 tonnes.

Eirebloc opens for business

In September 2008, Eirebloc, a new manufacturer of composite pallet blocks commenced production at Macroom, Co Cork. The company was established as a joint venture between Mid Cork Pallets and Palfab. It uses recycled wood as a raw material to manufacture pallet blocks in an environmentally-friendly process. Annual production capacity exceeds 60,000 m³ of finished product, for both the home and export markets.

Private sector roundwood production forecast

COFORD is currently undertaking an analysis of roundwood availability within the Irish private forest estate. It is expected that this forecast will be completed by July/August 2009.

Biomass/Bioenergy

The use of wood biomass in Ireland is dominated by the forest products sector, which uses it for process drying and for energy purposes. Since 2006, the use of wood energy by commercial and domestic users has risen (Table 9).
Co–firing with wood biomass

Four million tonnes of milled peat are harvested each year in Ireland from over 20,000 ha of peatland, the main markets for which are power generation, briquette manufacture and horticultural use. Around 3.08 million tonnes are used at three modern peat-fired power plants. They generate 6% of Ireland’s total primary energy requirement (TPER). However, the combustion process emits 2.8 million tonnes of carbon dioxide (CO₂) per annum. In 2007, Ireland’s greenhouse gas (GHG) emissions were 69.21 million t of carbon dioxide equivalent (Mt CO₂eq). Peat-fired electricity generation therefore accounts for 4.1% of total emissions. Research has shown that co-firing of peat with wood biomass could reduce emissions from peat fired power stations by up to 30%. Edenderry Power, a modern peat-burning power station operated by Bord Na Móna is currently working to increase the volume of wood biomass which is used as a feedstock for its electricity generating process.

Biomass fuelled combined heat and power (CHP)

There are currently three commercial wood fuelled biomass CHP plants in operation on the island of Ireland: Balcas Fuel Ltd, Grainger Sawmills Ltd and Munster Joinery Ltd. The heat and electricity output of these facilities are shown in Table 10.

It is anticipated that the REFIT tariff for biomass CHP of 12 cent/kWh, initially announced in January 2008 will be available for applicants from July 2009.
